Fertilizer Date Log

Feed gently, on schedule, and write it down.

GETTING STARTED

Most houseplants are not dying from a lack of food — they are suffering from twice feeding on a sunny Tuesday and then a three-month gap, or from one enthusiastic pour of full-strength plant food. This log keeps every feeding on the page, so a light hand at steady intervals replaces the feast-and-famine cycle.

PRINT IT RIGHT

- US Letter paper, portrait, 100 % scale (“Actual size”, never “Fit to page”).
- Keep the sheet with the watering rotation — feeding rides along on watering day.
- One sheet covers about two months for a small collection; print a couple at a time.

HOW TO FILL IT IN

- Record what the label actually says, then **dilute to half strength** unless the plant is a known heavy feeder.
- Feed only during spring and summer growth; taper off in fall and stop in winter.
- “Response” is what the plant did over the next week or two — new leaf, no change, brown tips. It teaches you the next cycle.

> **Tip:** Never feed a bone-dry plant, a freshly repotted one, or a sick one. Water first (or wait), and let the roots settle. Feeding is fertilizer for healthy plants, not medicine for struggling ones.

A free sheet from the Houseplant Helper Printables pack. Local PDF, no account needed. Your future self, reading last month's dates while holding a drooping fern, will be grateful.

Fertilizer Date Log

Season: _____ Remember: half the strength on the bottle, less often than you think.

READING THE LABEL: N–P–K IN PLAIN WORDS

N (nitrogen) = leaves. **P** (phosphorus) = roots and blooms. **K** (potassium) = overall health. A balanced houseplant food (numbers near each other, e.g. 10-10-10) at half strength covers almost everything.

FEED WINDOWS

Spring–summer: every 2–4 weeks, and always after watering. Fall: taper to once a month. Winter: skip — resting plants cannot drink it.

FEEDING RECORD

Date	Plant	Food + dilution	Amount	Response over next weeks	Next feed

Brown, crispy leaf tips soon after feeding usually mean the dose was too strong — pause, flush the pot with plain water, and halve the strength next time.
