Propagation Jar Tracker

Watch new roots appear, jar by jar, week by week.

GETTING STARTED

Snipping a friend's pothos and growing your own is one of the quiet joys of houseplants, and water propagation is where beginners should start: you can literally watch the roots arrive. This tracker keeps the methodical part — which jar is which, when the water last changed, when roots showed up — on one page, so ten jars stay ten experiments instead of ten mysteries.

PRINT IT RIGHT

- US Letter paper, portrait, 100 % scale ("Actual size", never "Fit to page").
- Number your jars with tape + a marker, then use the same numbers here.
- One sheet comfortably covers a shelf of jars; reprint for the next batch.

BASICS FOR A HAPPY JAR

- Cut just below a node (the bump leaves grow from) and keep that node underwater.
- Bright indirect light, room temperature, and tap water — let chlorine breathe off overnight if you can.
- Snip anything soft; one rotting stem can sour the whole jar.

> **Tip:** When roots reach about 3 cm, pot them up into damp mix and keep humidity high for a week (a clear bag loosely tented over works). Water roots and soil roots speak different dialects — expect a short pouting period.

A free sheet from the Houseplant Helper Printables pack. Local PDF, no account needed. Label the jars, tick the weeks, and let the roots do the rest.

Propagation Jar Tracker

Batch started: _____ Water-source note: _____

Jar	Cutting	Date in	Water changed (tick per week)	First root	Roots ≥ 3 cm	Potted into soil	Notes
1			○ ○ ○ ○ ○ ○		☐		
2			○ ○ ○ ○ ○ ○		☐		
3			○ ○ ○ ○ ○ ○		☐		
4			○ ○ ○ ○ ○ ○		☐		
5			○ ○ ○ ○ ○ ○		☐		
6			○ ○ ○ ○ ○ ○		☐		
7			○ ○ ○ ○ ○ ○		☐		
8			○ ○ ○ ○ ○ ○		☐		
9			○ ○ ○ ○ ○ ○		☐		
10			○ ○ ○ ○ ○ ○		☐		

READING THE WATER

Cloudy water is overdue for a change; a whisper of algae is survivable, but a slimy stem is a signal — trim back to healthy tissue, give the jar a proper wash, and restart with fresh water. Change the water about weekly, without letting the leafy part of the cutting ever sit submerged.

BEST FIRST TRIES

Pothos, philodendron, tradescantia, or a stubborn-hearted monstera node. Tall fussy plants — skipping ahead to soil is also allowed.

Survived: _____ / _____ starters
